

LSC Six-Month Progress Report

LIGO-M020100-00-M

Organization National Astronomical Observatory of Japan (NAOJ-TAMA)

Report Date February 15, 2002

The suspended-mirror RSE interferometer using the third harmonic demodulation as a signal extraction method was well characterized. The frequency response of the interferometer to the mirror displacement was measured with and without the signal extraction mirror. The measured transfer function agreed to the theory. Especially the signal enhancement by the RSE at higher frequencies was verified by the experiment.
